

Student Load Information

Student demographic information is extracted from the Student Information System (SIS) and is updated to the Library Information System (LIS), where library borrowers are either created or updated. Students can be extracted from SIS either by term or by original date. The student's original date is filled in when the student is initially created in SIS. If a student changes demographic information in SIS the original date does not change. If the libraries want the latest borrower demographic information from SIS they will need to extract by term. Updates to LIS are done when there is a student extract file from the colleges.

Starting with the spring semester in 2007 the colleges will run RDA031 by term for the week before classes and through the first week of class. On week two of classes the colleges will run RDA031 using the original date as the extract. This means when the colleges are extracting by original date the only students being extracted will be new students.
